

Project Initialization and Planning Phase

Date	15 September 2026
Team ID	SWTID-2026-7879
Project Title	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	5 Marks

Project Proposal (Proposed Solution) report

A scripted ACL is implemented to check a specific field value before granting access.

For example, a record may contain:

Access Level = Public / Restricted / Confidential

The ACL evaluates the value and determines whether the current user can access the record.

Project Overview	
Objective	The objective of this project is to implement a Script-Controlled Access Control List (ACL) in ServiceNow that restricts access to records based on a specified field value..
Scope	The project focuses on configuring a ServiceNow ACL that evaluates record-level information and dynamically determines whether the current user is allowed to access the record.
Problem Statement	
Description	Traditional role-based access control may allow users to access all records within a table even when certain records require additional restrictions.

Impact	Solving these issues will result in improved operational efficiency, reduced risks, and an overall enhancement in the lending process, contributing to customer satisfaction and organizational success.
Proposed Solution	
Approach	Employing machine learning techniques to analyze and predict creditworthiness, creating a dynamic and adaptable loan approval system.
Key Features	- Implementation of a machine learning-based credit assessment model.

Resource Requirements

Hardware		
Resource Type	Description	Specification
Computer	Development system	8 GB RAM or above
Processor	Development	Intel Core i3 or above
Software		
Resource Type	Description	Specification
Platform	ServiceNow	ServiceNow instance
Language	JavaScript	ServiceNow-supported JavaScript
Browser	Web browser	Chrome / Edge

Development	ServiceNow Studio	Required
